QUARTERLY REPORT

ET. CHARLES COUNTY WELL FIELD

MONITORING PROJECT

GRANT NO. DE-FG05-89OR21864

Prepared by: Stanley Remington
April May and June 1997

MONTHLY REPORT

APRIL 1997

BY

Stanley Remington

Consulting Hydrologist

1. CHEMICAL ANALYSES

The results from testing wells PW-8 and PW-9 were received from the American Technical and Analytical Services (ATAS) and are appended. These samples were taken on March 20, 1997. I had originally intended to sample PW-8 and RMW-2 but recent heavy rains prevented us from reaching well RMW-2. This sampling was the quarterly sampling with the Department of Energy. There are additional chemical parameters tested for at this time than is normally done. There were no unusual results. All of the test results showed that all of the chemical constituents were well within the NPDES limits.

The Quarterly Site and Quarry Water Treatment Plant Effluent Data Summary - First Quarter Report is appended. This report was written by the Department of Energy and summarized the results of the water analyses of the treated water batches from both the Quarry and Site treatment plants. All of the treatment test results show the effectiveness of the treatment process.

Well PW-2 was sampled on April 17, 1997. The results have not yet been received.

The results of the gross alpha and gross beta tests performed by the St. Louis County Department of Health is appended. Both the raw and finished (treated) water at the St. Charles County Water Treatment Plant were tested. The results of both tests show a normal historical range of readings.

II. FUTURE PLANS

I intend to sample well PW-5 sometime during mid May. If any treated samples from either the Quarry or Chemical Plant Site are ready for analyses I will also do these.

III. MISCELLANEOUS

Chemical tests were completed with the Department of Energy and St. Louis County on water treatment batch number 99. This was done on April 24, 1997.

The results have not yet been received.

Appended is the March 1997 Water Sales Report by the St. Charles County Water Department.

The results of the "Sample Analyses for Public Water Supplies" is appended. This sampling and testing was done by the Missouri Department of Natural Resources. The tests were carried out at the St. Charles County Booster Station and the samples were collected on February 8, 1996. They show the overall quality of the County's drinking water is good.

RE: ATAS #18444.01-#18444.02
Weldon Spring

Dear Mr. Remington:

Enclosed are the analytical reports for the samples received in our laboratory on March 20, 1997.

If, in your review, you should have any questions or require additional information, please call Rhonda Tinker, Assistant Project Manager, or me at (314) 434-4570.

Thank you for choosing ATAS for your analytical needs.

Sincerely,

Richard H. Mannz
Project Manager

MONTHLY REPORT

MAY 1997

BY

Stanley Remington

Consulting Hydrologist

I. CHEMICAL ANALYSES

The results from the testing of well PW-2 has been received and is appended. This test was done on April 17, 1997. The primary concern for this well are nitroaromatics, listed as explosives. No detections were noted for any of the nitros tested for. Also the radionuclides are all well within normal ranges.

The treated water from the chemical plant site was tested for on April 24, 1997. The results have been received and are appended. Again the results show that the treatment processes are functioning very well. This was batch number 99. The water was discharged into the Missouri River.

Well PW-5 was sampled on May 19, 1997, and was sent for analyses the same day. These results have not yet been received.

II. REPORTS

A report was received from the St. Louis County Department of Health showing the results of their testing for the raw and finished waters of the St. Charles Water Treatment Plant. The dates collected are shown as 3/1/97 to 3/31/97. The report was received on April 23, 1997. St. Louis County tested for gross alpha, gross beta, radium 226 and radium 228. Both the raw and finished waters showed very low quantities of these radionuclides.

The quarterly environmental data summary for the first quarter 1997 was received from the Department of Energy. The DOE concluded that, "All data received and verified during the fourth quarter were within a permissible range of variability except for some detailed below." The only significant finding was from well

PW-8 which showed gross alphas of 21.1 pCi/l and a reading of 73.9 pCi/l from the raw water intake at the County Water Treatment Plant. Their values are believed to be in error. They list several reasons for their beliefs. If you will note the St. Louis County measured the gross alpha from the same source just about the same time and came up with a reading of only 2.4 pCi/l. (See Above) Our own readings have never been that high so I can only conclude that they were right when they said they were in error. The report is appended for your review.

A quarterly report was received from the Missouri Department of Natural Resources dealing with their activities at the Weldon Spring Chemical Plant Site. It deals primarily with such items as foundation, soils, raffinate pit studies and bioremediation studies. It appears little, if anything, was done in or around our well field. I am enclosing the report for those who may have some interest in the MDNR activities during the first quarter of 1997.

III. FUTURE PLANS

I will sample well PW-4 sometime during mid June 1997. I will continue reading and monitoring any reports or activities by other agencies during the month.

IV. MISCELLANEOUS

Appended is the St. Charles County Water Sales Report for April 1997.

RE: ATAS #18725.01
Weldon Spring

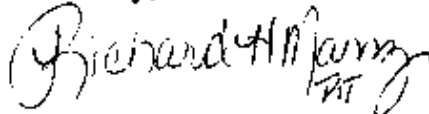

Dear Mr. Remington:

Enclosed is the analytical report for the sample received in our laboratory on April 24, 1997.

If, in your review, you should have any questions or require additional information, please call Rhonda Tinker, Assistant Project Manager, or me at (314) 434-4570.

Thank you for choosing ATAS for your analytical needs.

Sincerely,

Richard H. Mannz
Project Manager

RE: ATAS #18665.01
Weldon Spring

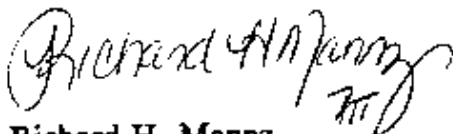

Dear Mr. Remington:

Enclosed is the analytical report for the sample received in our laboratory on April 17, 1997.

If, in your review, you should have any questions or require additional information, please call Rhonda Tinker, Assistant Project Manager, or me at (314) 434-4570.

Thank you for choosing ATAS for your analytical needs.

Sincerely,

Richard H. Mannz
Project Manager

QUARTERLY ENVIRONMENTAL DATA SUMMARY FOR FIRST QUARTER 1997

In support of the Weldon Spring Site Remedial Action Project Federal Facilities Agreement, a copy of the Quarterly Environmental Data Summary (QEDS) for the first quarter of 1997 is enclosed.

The data presented in this letter and attachment constitutes the QEDS. The data were received from the contract laboratories, verified by the Weldon Spring Site verification group and, except for air monitoring data, merged into the data base during the first quarter of 1997. Air monitoring data presented are the most recent complete sets of quarterly data. Air data are not stored in the data base.

Significant data, defined as data values that have exceeded defined "above normal" values, are discussed in this letter for Environmental Monitoring Plan (EMP) generated data only. Above normal values are based, in ES&H procedures, on historical high values, DOE derived concentration guides (DCGs), NPDES limits and other guidelines. The procedures also establish actions to be taken in the event that "above normal" data occur.

All data received and verified during the fourth quarter were within a permissible range of variability except for those detailed below. Above normal occurrences are cited for groundwater data and NPDES. There were none for air, surface water or springs. The following discussion offers a brief summary of the data that met the above normal criteria merged during the first quarter and updates on past reported above normal data. The attached tables present the most recent air data and all the data merged into the data base during the first quarter 1997 for groundwater, NPDES, surface water, and springs.

Graphs showing concentrations of selected contaminants of concern at some of the critical locations have also been included in this QEDS. The graphs are discussed in the separate sections.

NPDES

The uranium concentrations at the three major NPDES outfalls are graphed for November and December 1996 and January, February and

March 1997. The graph is located at the beginning of the NPDES tables. For comparison purposes, the annual average for 1996 is also graphed and the derived concentration guide (DCG) of 600 pCi/l for uranium is noted. The DCG is the concentration of a radionuclide in air or water which, under conditions of continuous exposure for one year by one exposure mode (i.e., ingestion of water), would result in an effective dose equivalent of 100 mrem. This is an administrative level established by the Department of Energy to maintain doses to members of the public "as low as reasonably achievable" (ALARA). Outfall NP-0010, the CMSA sedimentation basin outfall, has remained below the 1996 annual average and, because the area has been remediated, it is expected to remain so. Outfalls NP-0002 and NP-0005 have remained below the 1996 average except for March of 1997. The March sample was collected when the runoff was tailing off from an all day light rain. Uranium concentrations tend to be higher during this stage of the runoff. The remediation for the NP-0002 and NP-0005 watersheds has been completed, and after some initial fluctuations, the levels for uranium are expected to level off at low concentrations. The uranium levels at NP-0003 have been higher (except for the November 1996 sample) than the 1996 average. While most of the Outfall NP-0003 watershed has been remediated, the NP-0003 watershed contains Ash Pond where contaminated soils, concrete, etc., are being stored. This has contributed to the higher levels at NP-0003. In addition, uranium levels from Ash Pond have tended to be higher during the winter months. Although water is not released from the Ash Pond area if it is greater than 600 pCi/l, it may be higher than the 1996 average (at Outfall NP-0003), and thus, may contribute to higher levels at NP-0003. At no time did uranium concentrations at the three major outfalls exceed the DCG of 600 pCi/l.

There was one above normal sample at an NPDES outfall during the first quarter of 1997. The above normal sample, and above-normal samples that were not resolved in previous QEDS, are discussed below.

NP-0002-022097

Settleable solids for the sample collected at Outfall NP-0002 on February 20, 1997, were 5.5 ml/l/hr. The permit limit is 1.0 ml/l/hr. (Total suspended solids of 2,440 mg/l for this sample reflected the high settleable solids.) An unstabilized soil pile at the adjacent highway department facility was a major contributor to the high solids level. The PMC contacted the highway department and the highway department subcontractor erected several silt fences downstream of the piles. Subsequently, the PMC installed two sand bag check dams downstream of the silt fences and a rock check dam in the main channel just upstream of Outfall NP-0002. In addition, willow

cuttings and cat tails have been planted in the channel above outfall NP-0002 as a natural method to slow flow and trap sediment. A subsequent sample collected on March 10, 1997, was in compliance at less than 0.1 ml/l/hr. The PMC will continue to monitor settleable solids and inspect the watershed on a regular basis.

• NP-0005-110796, NP-0005-012297

The November 7, 1996, sample collected at outfall NP-0005 had an analytical result for Radium-226 (2.26 pCi/l) that was above the baseline value of 1.06 pCi/l. Radium - 226 is not a permitted parameter and there is no permit notification level. The elevated level is believed to be the result of higher than normal total suspended solids in the water in combination with upstream remediation efforts. This outfall was again sampled for Radium-226 on January 22, 1997, with an analytical result of 0.821 pCi/l (below the baseline). Periodic monitoring for radium will continue.

The analytical results for the NPDES outfalls are reported in the quarterly discharge monitoring report as well as in this report.

GROUNDWATER

Weldon Spring Chemical Plant Site

Site Water Treatment Plant and Temporary Storage Area

Sample Numbers GW-2037-Q496, GW-2037-0197, and GW-2037-0297

New historical high concentrations of the volatile organic compound (VOC) trichloroethene (TCE) were reported for the first quarter of 1997 at this location, which monitors groundwater along the western edge of the temporary storage area (TSA). The TCE results for samples collected in December 1996 and January and February 1997 were 1100 ug/l, 1200 ug/l, and 1300 ug/l, respectively. This location is included in the on-going, site-wide VOC groundwater investigation, which began in April, 1996.

• Sample Numbers GW-2038-Q496, GW-2038-0197, and GW-2038-0297

The fourth quarter VOC concentrations reported for samples from the MW-2038 groundwater monitoring location indicate decreasing levels of TCE. This monitoring well is situated between the south side of Raffinate Pit 3 along the north boundary of the temporary storage area. Levels reported for the previous quarter

were above 1000 ug/l. The TCE concentrations in samples collected in December 1996, January 1997, and February 1997; were 860 ug/l, 790ug/l and 860 ug/l, respectively, all of which are above the MCL of 5 ug/l. The MW-2038 sampling location is sampled monthly as part of the ongoing VOC impact investigation. Other investigation requirements are being developed.

- Sample Numbers GW-2040-Q396 and GW-2040-Q496

In an attempt to address a third quarter above-normal value for the metals lead and chromium, the fourth quarter sample was collected following three full-well volumes purged to reduce the potential for collection of water that has been in prolonged contact with the stainless steel well casing material.

The third quarter 1996 sample lead value(6.4 ug/l) was above baseline level (3.3 ug/l), but below the drinking water quality standard of 15 ug/l. The fourth quarter sample data (4.1 ug/l) were again above the baseline for lead. The reported chromium concentration (29.2 ug/l) was also above the baseline of 14.1 ug/l for this location. Monitoring well MW-2040 is located on the north side of the site water treatment plant equalization basin along the south side of the site water treatment plant Train I structure. Three additional wells that monitor the equalization basin, which are 100 feet to 150 feet down-gradient and cross-gradient from MW-2040, show no lead impact. The sources of the elevated lead and chromium are unknown and are under investigation because, although the three-volume purge reduced the potential for leaching of metals from the stainless steel well construction material, lead and chromium were still above baseline. Treatment plant influent chromium and lead values were not elevated and no other anomalous basin leachate values (such as elevated uranium) were identified.

Further investigation of potential sources is ongoing and includes sampling the water treatment plant sump, sampling the interceptor trench located between the equalization basin and Raffinate Pits 1 and 2, investigating the use of acids and salts in and around the treatment plant, and comparing metals analysis of a filtered sample duplicate with an unfiltered sample. The above-baseline values listed in this report are from unfiltered samples. The baseline values to which the current analytical results are compared were established utilizing values from filtered samples. The investigation findings should be useful in determining whether the difference in sample preparation methods (filtered vs. unfiltered) has a significant impact on analytical results.

- Sample Numbers GW-2042-Q396 and GW-2042-Q496

The MW-2042 sampling location is along the south side of the site water treatment plant equalization basin. The third and fourth quarter samples for chloride (15.8 mg/l and 20.6 mg/l) were above the baseline level of 11.3 mg/l. The source of elevated chloride is unknown. The source of the elevated chloride values around the water treatment plant may be acids used at the decontamination pad or road salts used around the plant. The elevated chlorides may also be related to the above-normal metals value at nearby location MW-2040 which is currently under investigation as described in the previous paragraph.

Disposal Cell

Groundwater sampling from the site disposal cell detection monitoring well network was initiated during the first quarter of 1997. The wells MW-2045 through MW-2048 (installed during late 1996-early 1997) and MW-2032 will be sampled quarterly during 1997 to determine baseline groundwater contaminant concentrations. Abnormal or unexpected values will be reported in subsequent QEDS as the analytical results become available.

Weldon Spring Chemical Plant and Raffinate Pits

- Sample Numbers GW-2013-0197 and GW-2013-0297

The VOC 1,2-dichloroethene was detected in the January 1997 sample from this location, along the south side of Frog Pond, at 15 ug/l, but the February 1997 sample was below the 10 ug/l detection limit. The VOC source at this sampling location is suspected to differ from that which impacts the area around Raffinate Pits 3 and 4, since TCE is not the primary VOC contaminant. Even though the source is suspected to be different, this sampling location has been included in the site VOC groundwater investigation and will continue to be monitored through 1997.

- Sample Numbers GW-3025-121896 and GW-3025-0197

TCE was monitored at this location during the fourth quarter of 1996 (27 ug/l) and first quarter of 1997 (38 ug/l). This location is along the east side of Raffinate Pit 3 and is included in the current VOC investigation mentioned in the previous paragraphs. These TCE concentrations do not indicate

any significant change in concentration from the third quarter 1996 sample (GW-3025-Q396 = 29.0 ug/l). The values exceed the MCL of 5 ug/l.

Weldon Spring Quarry Site

Quarry Water Treatment Plant

- Sample Numbers GW-1036-Q296, GW-1036-Q396 and GW-1036-Q496

The fourth quarter sample for monitoring location MW-1036 was again above the baseline level of 102 mg/l for chloride at 120 mg/l. Chloride concentrations above baseline levels were also reported in two previous QEDS. The second quarter 1996 sample value (518 mg/l) was the highest recorded for this location. Third quarter data (130 mg/l) indicate that the chloride concentration remains above baseline level, but is significantly decreasing. The fourth quarter chloride (120 mg/l) concentration indicates that the values are continuing to decrease and are now near baseline. Chromium was reported above the baseline level of 7.57 ug/l in the previous quarter, but it has decreased to 6.4 ug/l, which is within baseline. The chloride impact, and the related increase in metals concentration, were most likely due to the use of hydrochloric acid used for cleaning equipment during late 1995 and early 1996 at the decontamination pad, which was in need of repairs. Cracks in the decontamination pad were repaired in August 1996, and the chloride and chromium values are decreasing as expected.

- Sample Numbers GW-1040-Q296, GW-1040-Q396, and GW-1040-Q496

Three consecutive chloride historic highs above the baseline concentration of 10.9 mg/l for this location have been reported. HCl was used in the quarry decontamination area during late 1995 and early 1996. The chloride concentration has not decreased at this location as quickly as the MW-1036 sampling location. The chloride value decreased from 25.8 mg/l in the second quarter sample to 21 mg/l in the third quarter sample, but increased to 31 mg/l for the fourth quarter. Cracks in the decontamination pad at the quarry were repaired in August 1996. Subsequent data are expected to show decreases in chloride values.

Quarry Vicinity

- Sample Numbers GW-1005-B596 and GW-1005-B696

Two consecutive new historic highs for total uranium were reported for the fifth and sixth bimonthly 1996 samples (5380

pCi/l and 6920 pCi/l) from this location. This well had been dry from mid-1995 to late 1996 due to groundwater level decreases resulting from quarry pond dewatering. It is possible that contaminated residual sediments that have accumulated in bedrock conduits, through which groundwater flows to this location, are being remobilized as the groundwater level rises and recharges the well. When sufficient water volume recharges this well, additional surging and purging of the groundwater in MW-1005 will be performed to determine if residual sediments are the source and, if so, subsequent samples should show decreasing total uranium activity. Further, first quarter 1997 samples collected from this location included a filtered replicate that will be compared to the standard unfiltered sample to determine the potential for suspended solids contributions to the increased total uranium activity.

St. Charles County Well Field

- Sample Numbers GW-PW08-Q496 and GW-RAWW-Q496

Gross alpha values were reported above the MCL of 15 pCi/l for the St. Charles County pumping well PW-08 (21.1 pCi/l) and the for the raw water intake at the county water treatment plant (73.9 pCi/l). These values are believed to be in error for the following reasons. No wells upgradient or crossgradient from PW-08 showed any increased alpha or total uranium activities. Further, the RAWW sample is a composite of all wells pumping to the treatment plant and should approximately equal the average gross alpha value of the wells contributing to the treatment plant. The reported average for this sampling event during fourth quarter 1996 was 5.6 pCi/l. The treated water sample from the plant (GW-FINW-Q496) had a gross alpha activity of 2.57 pCi/l.

Total uranium activities during the last four sampling events for groundwater in the St. Charles County well field are shown graphically at the beginning of the Groundwater Tables.

SURFACE WATER

No elevated contaminant values were reported in surface water samples for the quarter.

SPRINGS

No elevated contaminant levels were reported for Burgermeister Spring during this quarter.

AIR

There were no above normal samples for air monitoring for the first quarter of 1997. Data for the monitoring locations are attached. Graphs of the monitoring results are located in front of the tables.

The gross alpha concentration for air particulate monitoring for the first quarter 1997 are graphed with the background level and background plus 3 standard deviations shown for comparison. The background level is based on monitoring conducted from the second quarter 1996 to the first quarter of 1997. The background location is AP-4012 at the Daniel Boone Elementary School in New Melle.

The gamma exposure from environmental TLD monitoring results for the fourth quarter 1996 are graphed with the background and the background plus 25 mrem quarterly committed effective dose equivalent (CEDE) shown for comparison. The 25 mrem CEDE is based on one-fourth of the annual 100 mrem CEDE established in DOE Order 5400.5. The background locations are TD-4005 (west of the Army site) and TD-4009 (Daniel Boone Elementary School in New Melle).

The alpha track radon and thoron monitoring results are graphed for the fourth quarter of 1996. The background level (based on 1996 monitoring) and the derived concentration guide (DCG) for radon and thoron are shown for comparison. The DCG is a reference value for protection of the public and the environment contained in DOE Order 5400.5. Although some locations are above the DCG they are all within the site boundary. All locations identified with R3--are located inside the WSSRAP fence line. The background locations are TD-4005 (west of the Army site) and TD-4009 (Daniel Boone Elementary School in New Melle).

SUMMARY

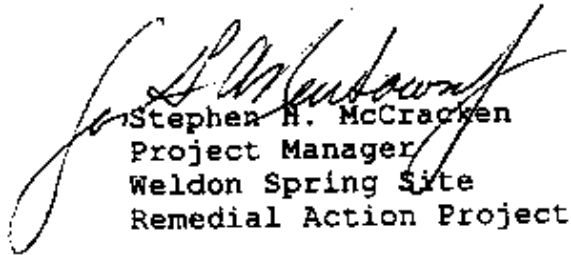

The previously described data were highlighted as being above prescribed baseline values, varying from historical ranges or being above regulatory limits, and as a result, are subject to more focused attention by the WSSRAP Environmental Protection Group. Continuous trends are monitored to determine the need for additional possible action. Except for the highlighted data, all other indicators subject to reporting in the QEDS were within historic range or below reporting criteria.

Mr. Steve McCracken, DOE Project Manager
Weldon Spring Site Remedial Action Project
7295 Highway 94 South
St. Charles, MO 63304

Dear Mr. McCracken:

This quarterly report summarizes the activities and follow-up of issues associated with MDNR's oversight role at the Weldon Spring Site Remedial Action Project (WSSRAP). This report covers the time period from January 1, 1997 through March 31, 1997.

As stated, this report covers the first quarter of calendar year 1997. The information for this report was compiled by Ms. Martha Windsor, Mr. Glenn Carlson, and Mr. Robert Stovall. As always, your comments and suggestions on this report are encouraged.

If you desire additional information regarding specific issues mentioned in this report, please contact me at (573) 751-6838.

Sincerely,

Federal Facilities Section

Quarterly Report Summary

Introduction and Purpose

This report summarizes key activities at the Weldon Spring Remedial Action Project (WSSRAP) site by the Department of Energy and their contractors for site remediation activities. It also summarizes Missouri Department of Natural Resources (MDNR) oversight activities at WSSRAP to ensure that the Department of Energy and their contractors are protecting human health and the environment during the site remediation process. The time period covers site activities from the First Quarter of 1997.

First Quarter 1997 (January 1997 to March 1997)

Site Activities During First Quarter

Kathy Coutros and Glen Newtown of DOE were re-assigned from the Project Engineering position on the Chemical Solidification & Stabilization plant. Ed Valdez is no longer with WSSRAP and is now the Project Manager for FUSRAP.

On February 20, 1997, there was a NPDES exceedance violation for the SWTP on the settleable solids limit of 1.0 ml/L/hr.

At WSSRAP the Department of Energy and the Project Management Contractor completed removal of the building foundations including removal of unsuitable soils and placement of low permeability soil to bring the foundations up to grade. Low permeability soils were placed as fill for the excavation and for the footprint of the disposal cell. The PMC is working toward

the completion of this project by the end of May 1997.

The Department of Energy and the Project Management Contractor completed removal of the contaminated soil and foundations within the disposal cell foot print. Clean up of the contaminants of concern to clean up goals in accordance with the Record of Decision was confirmed via confirmation sampling of the soils. MDNR will be reviewing the data and providing comments during the next quarter.

Sludge consolidation continues at Raffinate Pit #4. Sludge was removed from Raffinate Pit #1 and Raffinate Pit #2. High nitrate water from Raffinate Pit #3 was transferred into Pit 1 and Pit 2 for biodenitrification and subsequent treatment in the Site Water Treatment Plant.

Construction of the Chemical Stabilization and Solidification Plant (CSS) has started. The Project Management Contractor is currently leveling the ground for the plant foot print and installation of a clay liner material for the plant tanks. The plant is to be constructed by integration of prefabricated equipment modules. The prefabricated equipment modules are being built off site. The modules will arrive at the site mid-June for plant construction. The sludge inventory storage tanks and the thickener required for the CSS plant will be fabricated in place at the site.

Approval for the fifth year budget of the Agreement-In-Support for MDNR was received on March 31, 1997. The budget period is from February 1, 1997 to January 31, 1998. The approved budget is \$300,000 less than the budget request. Amendments to increase the approved budget are expected by MDNR.

Treatment of the wastewater from the Weldon Spring Site at the Site Water Treatment Plant and Quarry Water Treatment Plant

continues. The Missouri Department of Natural Resources Hazardous Waste Program continues to take split samples with the Department of Energy to ensure compliance with the NPDES permit discharge requirements. There were four (4) batches from the SWTP analyzed and one (1) batch analyzed from the QWTP. These results are shown in the appendix.

Federal Facilities Staff Oversight Activities

On March 18, 1997, Federal Facilities Staff briefed MDNR Director David Shorr to provide the status of Federal Facilities oversight at the Weldon Spring Site (WSSRAP), and the major issues at WSSRAP.

Federal Facilities Staff provided comments on the Engineering Soils Plan for the Raffinate Pits. The Department of Energy (DOE) responded to MDNR's comments regarding sampling for volatile organic compounds including trichloroethylene sampling and characterization. The Department of Energy's responses to MDNR's comments were that they would conduct sampling for trichloroethylene and determine the extent of the contamination.

Federal Facilities Staff provided comments on the Nitrosoils Bioremediation Study Report. The Department of Energy (DOE) responded to MDNR's comments. MDNR comments on this document stated that the data supplied was difficult to interpret and the results of the study was inconclusive. The Department of Energy agreed that additional studies were necessary to characterize the data, but the data in this study did provide useful bioremediation characterization data.

All Department of Energy WP 420 Soils Confirmation Units were determined by the Department of Energy to be clean. Currently MDNR staff is reviewing the soils confirmation data to confirm that the contaminants of concern have been remediated to the

clean up levels specified in the Record of Decision.

Federal Facilities Staff provided comments on the 100% Design for the Raffinate Pits Dredge System and the 100% Design Operations Plan for the CSS Plant. MDNR's concerns were the frequency of testing for the quality grout product being produced by the CSS process, and whether the grout would meet the minimal compressive strength requirements. The Department of Energy adequately addressed these concerns.

Federal Facilities Staff provided comments on the Quarry Residuals Draft Remedial Investigation and the Quarry Residuals Draft Baseline Risk Assessment. The major concern for the Quarry Residuals Remedial Investigation and the Baseline Risk Assessment was contaminant migration towards the St. Charles County well field, particularly for the contaminant of concern Uranium. Currently MDNR and the Department of Energy are discussing exposure scenarios with respect to St. Charles County Well field. The preliminary draft Feasibility Study and Proposed Plan were issued to MDNR on April 18, 1997, for review and comment.

Federal Facilities Staff provided comments on the South East Drainage 90% Design. The Department of Energy will start remedial action for this area in August 1997 and the remediation of this area is to be completed in February 1998. Currently MDNR and the Department of Energy are discussing the method of confirmation which can best determine the adequacy of the cleanup to proposed cleanup levels.

Federal Facilities Staff provided review and comments on the Final Draft of Groundwater Operable Unit Remedial Investigation and the Final Draft of the Groundwater Operable Unit Baseline Risk Assessment. The Department of Energy has unsatisfactorily addressed MDNR's comments and concerns regarding these two documents. However, there are a number of issues which are

currently still under negotiation. Currently, notification to invoke dispute resolution has been given. The main issue is the clean up of the contaminants of concern to residential or unlimited use levels.

Federal Facilities Staff is still coordinating with the Water Pollution Control Program regarding the proposed changes on the Uranium limit for the NPDES permit at WSSRAP. This change will require the concurrence of the Clean Water Commission. The Commission approved two stays regarding this issue in their March 26 meeting. The issue of discharge of disposal cell leachate to Dardenne Creek will require a Clean Water Commission rule change.

The MDNR Hazardous Waste Program issued a request for proposal for analytical services for analysis of radioactively contaminated wastewater, groundwater, and soils. The finalized contract for analytical services will allow MDNR to provide oversight via split sampling with the Department of Energy to determine if the Department of Energy Laboratory's analysis coincides with independent monitoring and to ensure that clean up criteria has been reached for each media sampled.

Federal Facilities Staff Field Activities

Federal Facilities staff has provided oversight on the following projects at the WSSRAP site:

- Raffinate pits sludge consolidation and sludge removal.
- Low permeability soils placement for the disposal cell.
- Borrow area low permeability soils removal Lake 36 characterization.

Staff Training

Ed Sadler, 01:02 PM 5/15/97 , MDNR quarterly report

On January 8, 1997, Larry Erickson received the Annual SHARP Refresher for radiation and health safety.

February 27 and 28, 1997, Glenn Carlson attended training on the disposal cell design.

In March, Federal Facilities Staff attended training at WSSRAP regarding oversight of the low permeability soil placement for the disposal cell. Training included the ASTM specifications and testing and quality control methods used for determining the acceptability of the low permeability soils used in the disposal cell construction.

On March 20, 1997, Robert Stovall received the Annual SHARP Refresher for radiation and health and safety.

Meetings/Community Relations

Federal Facilities Staff attended the monthly St. Charles Citizens Commission meeting at the WSSRAP site. The staff met with the St. Charles Citizens Commission on January 23, 1997, February 27, 1997, and March 27, 1997.

MONTHLY REPORT

JUNE 1997

BY

Stanley Remington

Consulting Hydrologist

I. **CHEMICAL ANALYSES**

The results from the testing of well number PW-5 were received and are appended. This well was tested on May 19, 1997. All of the results were within the NPDES limits and historical ranges. Only gross alpha and gross beta, total uranium, and nitroaromatics were tested.

The results from the St. Louis County Department of Health were received for the gross alpha and gross beta readings of raw and finished water from the St. Charles County Water Treatment Plant. They are appended. These are composite samples from all of the wells pumping when the samples were taken. The time period covered was 4/1/97 - 4/30/97. Both parameters were well below the NPDES limits.

Wells RMW-2 and PW-9 were sampled with the Department of Energy on June 19, 1997. The results have not yet been received. This was the quarterly sampling period.

II. **FUTURE PLANS**

I will undergo major surgery on July 3, 1997. I do not know at this time how long it will take to recover, so I can not plan anything for the month of July at this time. Hopefully I will be able to sample one well near the end of July, or if not, in August.

III. **MISCELLANEOUS**

Enclosed is the May 1997 Water Sales Report by the St. Charles County Water Department.
